Travis Terry

Senior Full Stack Engineer | Sterling Heights, Michigan | travisjterry@gmail.com
248-505-9421 | linkedin.com/in/travisjterry | travisjterry.dev | github.com/travist6983

Summary

Senior full stack engineer with 15+ years of experience shipping production systems end to end, from React and Vue front ends to C#, .NET, and Python services, LLM pipelines, and native iOS. Built and owned a 150 component React design system, then expanded into full stack AI work, shipping LLM features used by about 10,000 monthly active users and contributing to a production MCP server.

Specializes in agentic engineering with real guardrails. Built a system of 30+ Claude Code skills that cleared 100+ bugs and shipped about 25 features in six weeks with a 95% first pass acceptance rate, and cut regression cycles from a week to under a day. Led the team's AI adoption, mentored junior engineers toward senior roles, and independently ships AI products, including a child safe learning platform and a native iOS app.

Skills

Agentic AI: Claude Code custom skills and commands, Cursor, autonomous agent loops, agent workflows, tool orchestration, verifier agents, LLM code review, AI driven test execution, MCP server development, tool design, question classification and routing

LLM Engineering: LLM client integrations, multi provider model routing, RAG, embeddings and vector retrieval, grounded answers, prompt and context engineering, LLM moderation and prompt level safeguards

AI Safety and Controls: Human approval gates for sensitive areas like billing and auth, risk tiered retry limits, global kill switches, destructive actions kept out of LLM reach, COPPA driven consent and moderation

Front End: React, Next.js, TypeScript, JavaScript, Vue 3, HTML5, CSS3, SCSS, Vite, npm, 150 component design system, design tokens, accessibility, responsive layouts, Swift (iOS)

Back End and Data: C#, .NET, REST APIs, SignalR, Python, FastAPI, Node.js, Auth0, Stripe, Redis, Cosmos DB, Postgres, SQL Server, Azure SQL, MySQL, Oracle

Cloud, CI/CD and Testing: Azure Pipelines, Azure App Service, GitHub Actions, Fly.io, Neon, Cloudflare Workers, Workers AI, Vectorize, Playwright, Vitest, TestRail, BrowserStack, Litmus, daily deploys with weekly release trains

Integrations and Platforms: Jitterbit (on prem and Harmony Cloud), Salesforce, NetSuite, SuiteCommerce, WordPress, Jira and Azure DevOps APIs

Leadership: Engineering wide AI adoption, code review standards, design system governance, mentoring, people management

Experience

Atlas UP | Staff Software Engineer | Remote | June 2025 to October 2026

Joined through Atlas UP's acquisition of EOS One from EOS Worldwide; retained as one of three staff engineers as the team went from 35 to 9.

- Sole author of an agentic engineering system of 30+ chained Claude Code skills that took Jira tickets from reproduction through fix, verification, regression, and code review; cleared a backlog of 100+ bugs and shipped about 25 features in six weeks with a 95% first pass acceptance rate from code review and QA.
- Built a persistent knowledge base the agents used to drive the app, with a nightly consolidation process that pruned contradictions and duplicate lessons learned; pull requests included before and after videos.
- Designed the system's safety model: independent verification by a separate agent with fresh context, retry limits by risk tier, mandatory human review for sensitive areas like billing and auth, and a global kill switch to pause all agent loops.
- Removed QA as a release bottleneck by building an AI regression lane that ran TestRail cases through Claude Code and Playwright, scoped to each release's blast radius, cutting regression cycles from about a week to 8 to 12 hours.
- Built an autonomous pull request review agent that scanned Azure DevOps hourly and reviewed every PR for six weeks, hundreds in total, ranking findings by severity and posting fix suggestions directly on each PR.
- Core contributor on the production MCP server for EOS One, helping build the question classifier and tool layer that let customers connect Claude, ChatGPT, and Grok to their data, with destructive actions deliberately kept in app and never exposed to LLMs.
- Co-designed the LLM and chatbot architecture as one of three staff engineers, establishing the patterns for AI features across the platform.
- Owned the AI powered Accountability Chart and V/TO builders end to end, from Python microservices and LLM integration through the React UI; the Accountability Chart builder became the platform's most used AI tool across roughly 10,000 monthly active users.
- Contributed across a C#, .NET, SignalR, Redis, and Cosmos DB stack and Python LLM microservices.
- Led the team's AI adoption from light Cursor use to Claude Code, prompt engineering, and ultimately autonomous agent loops and harness engineering; teammates adopted the skills I wrote after seeing my delivery rate climb.
- Continued to own and extend the EOS One component library post acquisition.

EOS Worldwide | Staff Front End Engineer (Dec 2024 to June 2025), Senior Front End Developer (Feb 2023 to Dec 2024) | Remote

- Architected and built the EOS One React component library from the ground up, delivering about 150 components, front end services, and a design token based styling system that set the architecture, patterns, and standards the product still runs on.
- Promoted to Staff Front End Engineer and managed three direct reports through one on ones and growth planning while staying hands on in delivery.
- One of three senior engineers on a predominantly junior team; personally reviewed every front end pull request and mentored four to five junior developers who were on track for senior roles by the end of their tenure.
- Expanded from front end into full stack delivery as AI tooling matured, contributing across C# APIs and services and building early Python microservices.
- Built voice activated note taking for EOS One's real time SignalR meetings, backed by a Python microservice that recorded sessions, generated notes, emailed summaries afterward, and suggested to dos for each team member.
- Led front end unit testing with Vitest and CI/CD quality gates, bringing front end services to about 85% test coverage.

Qualfon (formerly Dialog Direct and Budco) | Highland Park, Michigan | April 2011 to February 2023

Senior Developer; previously NetSuite Team Lead, NetSuite Developer, WordPress Developer, and Email Marketing Coordinator

- Built and maintained about 15 NetSuite SuiteCommerce B2B instances serving 100,000+ users.
- Core developer on an in house multi tenant Vue and C# e-commerce platform with a shared core, migrating clients off NetSuite and building per customer customizations.
- Led the NetSuite team of five direct reports, owning delivery, technical direction, and client facing requirements in partnership with product owners.
- Built Jitterbit data integrations connecting on premise Oracle and SQL Server databases with NetSuite, Salesforce, and internal APIs.
- Built and analyzed performance and load tests across web and mobile applications, tracing bottlenecks from IIS down to slow SQL queries.

Sotheby's International Realty (SKBK) | Developer, Systems Operations | Birmingham, Michigan | June 2006 to March 2011

Independent Projects

FoundrKids | Founder and Sole Engineer | February 2026 to Present

AI and entrepreneurship learning platform for kids 8 to 15 (pre-launch), where an AI coach guides kids through building missions while parents track safety.

- Built the full stack solo: three Vue apps, a FastAPI backend, Postgres with pgvector, Redis, and Stripe on Fly.io and Neon, plus an adaptive learning engine backed by about 2,500 tests.
- Designed a six layer safety model on every model call: block list, OpenAI moderation, prompt scaffolding, the model, a streaming sentence buffer, and a PII redacting output filter; fails closed, ending the session and alerting the parent on critical events.
- Built cost controlled model routing across Anthropic and OpenAI by mission tier, with cross vendor failover and a monthly spend cap per household.
- Built COPPA compliance into the data layer: verified parental consent, 90 day chat purge, real child deletion, and tamper proof audit logs.

Pocket Chronicles | Founder and Sole Engineer | July 2026

Native iOS family memory app, live on the App Store.

- Shipped solo from concept to App Store in about a month by directing AI agents outside my primary stack.
- Built with SwiftUI, SwiftData with offline sync, StoreKit 2, Sign in with Apple, and on device transcription and Foundation Models, backed by an async FastAPI and SQLAlchemy service on Postgres, deployed to Fly.io.
- About 2,700 automated tests and 200 merged PRs, with written specs and decision logs behind every change.

RoleHawk | Creator and Sole Engineer | October 2026

Free, open source, local first AI job search copilot that takes users from resume to offer.

- Built the full stack solo: React 18, TypeScript, and TanStack Query on the front end, Python FastAPI, SQLAlchemy, SQLite, and Playwright on the back end, shipped as a one line installer for macOS, Windows, and Linux.
- Designed anti hallucination guardrails: tailored CVs and cover letters pull facts only from the user's profile, then a fact checker and a separate AI review verify them.
- Routed models by cost, with Haiku for ranking and Opus for writing, plus a monthly spend cap and cost estimates shown before each batch runs.
- Built in privacy and safety by design: runs only on localhost, keeps API keys in the OS keychain, sends no telemetry, and treats job postings as untrusted input to block prompt injection.

travisjterry.dev | Personal Site | October 2026

Next.js, React, and TypeScript resume site with an "Ask Travis" RAG assistant.

- Built an "Ask Travis" RAG assistant using Cloudflare Vectorize with top 8 retrieval; Claude returns structured JSON with a grounded flag and hands off to email when sources don't support an answer.
- Secured it with a TypeScript Cloudflare Worker proxy that keeps API keys out of the browser, with Turnstile, an origin allow list, rate limits, and a daily spend cap.
- Static Next.js 15 and React 19 export deployed to GitHub Pages via GitHub Actions, with GSAP and Lenis scroll animations, reduced motion support, a motion pause switch, and a 100 Lighthouse accessibility score.

Education

Associate of Applied Science, Computer Science | ITT Technical Institute, Troy, Michigan
